| Complexity | 1,830 | 0.089 | 0.756 | -2.210 | -0.446 | 0.547 | 5.865 |
| Left-Right | 1,830 | 0.010 | 0.760 | -2.356 | -0.921 | 0.684 | 1.102 |
| Progressive-Conservative | 1,830 | -0.079 | 1.005 | -3.628 | -0.487 | 0.828 | 3.110 |

B Government-opposition status

What about the impact of government-opposition on linguistic complexity? Figure B.1 shows the regression coefficient for the government-opposition status variable, which indicates the difference between government parties and opposition parties. Surprisingly, the results are rather inconsistent: Government parties use more complex language than opposition parties in Germany, Sweden and Denmark, but the pattern is reversed in the United Kingdom, and we find no relationship between government status and complexity in Spain. Furthermore, the Dutch parliamentary data indicate a positive relationship, whereas the party congress data indicate no relationship. These results show that, across countries and contexts, the relationship of being in government and language complexity is less clear-cut than in the US-American and Canadian contexts where speakers from opposition parties use less complex language than speakers from government parties (see for example Tetlock, 1981; Pancer et al., 1992).

Figure B.1: OLS regression of complexity on government status and time

Note: This plot reports standardized regression coefficients for government-opposition status in seven OLS regression models (one for each dataset in the corpus with the prime minister speeches excluded). The bars represent the 95% confidence intervals of the coefficients.
